

Term Test Bb version 2

(1) [5 points] Project $\vec{u} = (44/3, -127/3, 148/3)^\top$ onto the plane H containing $P = (-2, 3, -2), Q = (-1, 5, 1), R = (2, 6, 2)$ in order to find the distance between \vec{u} and H . (Hint: If u_H is the projection, then the distance is $\|u - u_H\|$).

(2) [5 points] Consider the following function:

$$f\left(\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} y \cos(xy) \\ 2x^2 + y^2 \end{bmatrix} \quad (1)$$

Linearize the function around $x = \pi, y = 2$ so it looks as follows,

$$f(x) \approx E + \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} x - M \\ y - N \end{bmatrix} \quad (2)$$

Specify the numbers A, B, C, D, E, M, N in your solution.
